Course at a glance

1. Introduction

Food processing and preservation is a set of physical, chemical and biological processes that are performed to prolong the shelf life of foods and at the same time retain the features that determine their quality, like color, texture, flavor and especially nutritional value. Food preservation is achieved by destroying enzymes and microorganisms using heat (blanching, pasteurization), or preventing their action by: removal of water, or increasing acidity or using low temperatures.

2. Course objectives :

1. To improve participant's skills in designing and implementing food processing operations in their own jurisdiction.
2. To develop advanced knowledge and idea of participants to investigate various parameters involved in food processing and preservation with respect to their influence on final product quality and safety
3. To develop knowledge of personnel working in agriculture about processing steps involved in a range of contemporary and novel manufacturing operations

Target population : Officers of different organizations under Ministry of Agriculture.

Duration of each session: 60 minutes.
